FRAME

SCALE

A significant proportion of young adult cancer survivors report **experiencing clinically relevant symptoms of anxiety, depression and post-traumatic stress.** More than 22% have reported mental health symptoms, compared to 14% of those who haven't had cancer – a statistically significant difference.

Research conducted by CanTeen (an Australian organisation for young people living with cancer) – shows almost 40% of survivors aged 12 to 24 report **high or very high levels of psychological distress** at the time of accessing support.

Increase resilience in adolescent and young adult cancer survivors.

Off you go.
